

▼ Project: Querying and Filtering Pokemon data

This project will help you practice your pandas querying and filtering skills. Let's begin!

▼ Task 0 - Setup

There isn't much to do here, we'll provide the required imports and then read the pokemon CSV we'll be working with.

```
In [2]: import numpy as np
import pandas as pd

import matplotlib.pyplot as plt
import seaborn as sns
```

```
In [3]: df = pd.read_csv("pokemon.csv")
```

In [4]: `df.head()`

Out [4]:

▼ Basic filtering

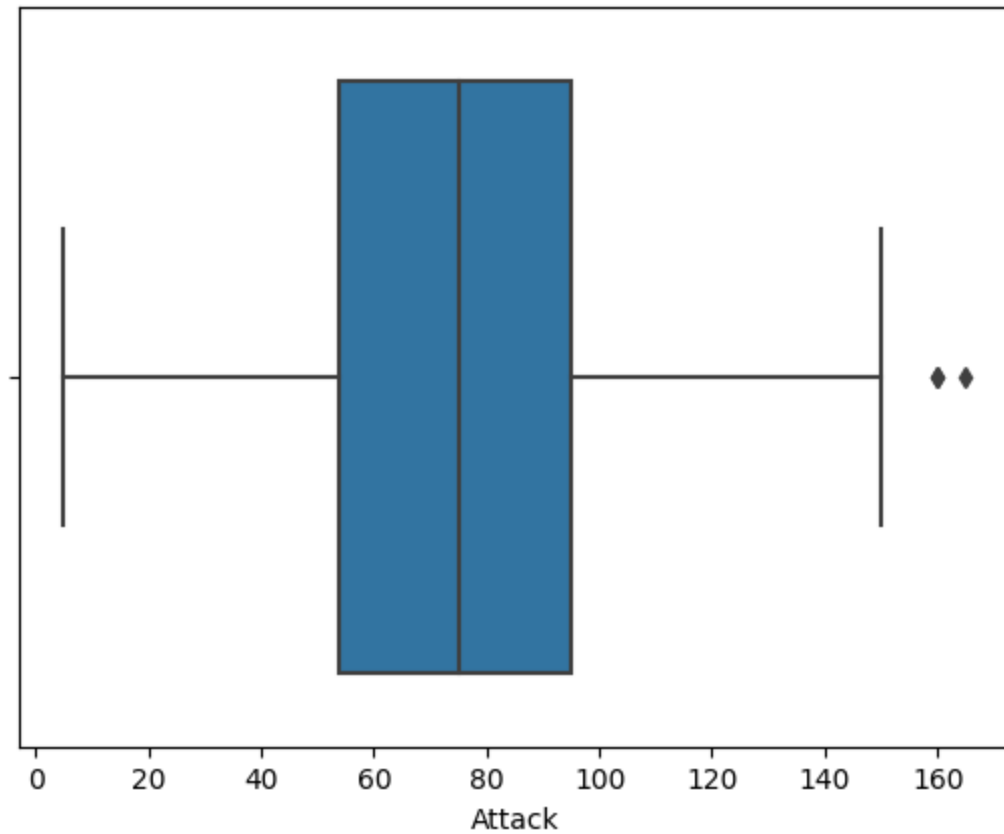

Let's start with a few simple activities regarding filtering.

▼ 1. How many Pokemons exist with an Attack value greater than 150?

Doing a little bit of visual exploration, we can have a sense of the most "powerful" pokemons (defined by their "Attack" feature). A boxplot is a great way to visualize this:

```
In [11]: sns.boxplot(data=df, x='Attack')
```

```
Out[11]: <Axes: xlabel='Attack'>
```

```
In [13]: # Try your code here
df.head(1)
```

```
Out[13]:
```

	#	Name	Type 1	Type 2	Total	HP	Attack	Defense	Sp. Atk	Sp. Def	Speed	Generation	Legend
0	1	Bulbasaur	Grass	Poison	318	45	49	49	65	65	45	1	Fa

```
In [15]: filt = (df['Attack'] > 150)
df[filt]
```

```
Out[15]:
```

	#	Name	Type 1	Type 2	Total	HP	Attack	Defense	Sp. Atk	Sp. Def	Speed	Generation	Legend

```
In [17]: df.query("Attack > 150")
```

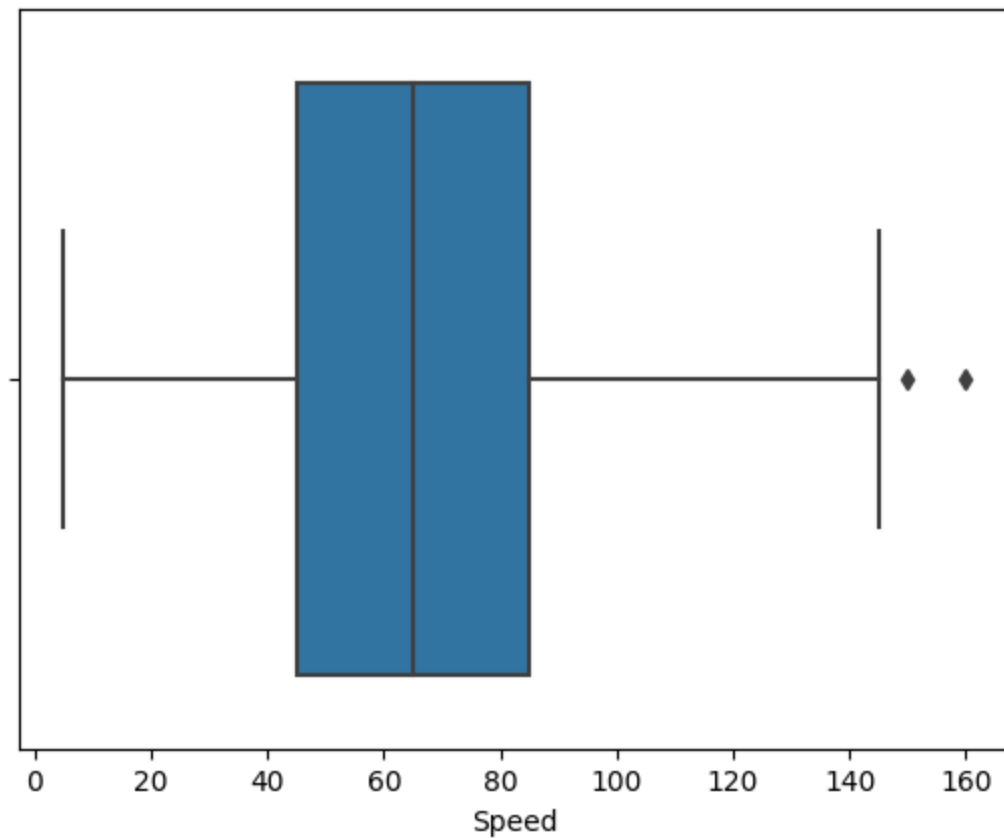

```
Out[17]:
```

485	486	Regigigas	Normal	NaN	670	110	160	110	80	110	100	4	

▼ **2. Select all pokemons with a Speed of 10 or less**

```
In [18]: sns.boxplot(data=df, x='Speed')
```

```
Out[18]: <Axes: xlabel='Speed'>

▼ 3. How many Pokemons have a Sp. Def value of 25 or less?

```

▼ 5. Find the outlier

Find the pokemon that is clearly an outlier in terms of Attack / Defense:

```
In [25]: ax = sns.scatterplot(data=df, x="Defense", y="Attack")
ax.annotate(
    "Who's this guy?", xy=(228, 10), xytext=(150, 10), color='red',
    arrowprops=dict(arrowstyle="→", color='red')
)
```

Out[25]: Text(150, 10, "Who's this guy?")

```
In [39]: # Try your code here
filt1 = df['Attack'] < 20
filt2 = df['Defense'] > 200
df[filt1&filt2]
```

Out[39]:

	#	Name	Type 1	Type 2	Total	HP	Attack	Defense	Sp. Atk	Sp. Def	Speed	Generation	Legend
212	213	Shuckle	Bug	Rock	505	20	10	230	10	230	5	2	Fa

```
In [41]: df.sort_values(by=['Defense', 'Attack'], ascending=[False, True]).head(1)
```

Out[41]:

Advanced selection

Now let's use boolean operators to create more advanced expressions
